

# Let the sunshine in...

**The sun's light governs our life from the beginning.**

But we spend too much time in badly-lit rooms - whether we are in the office, at work or at home. This often leads to headaches, blurred vision and poor concentration - or even depression.

## The DeskLight...

- ... gives off a light similar to the sun's own light
- ... is really good for the eyes
- ... has a positive effect on the attitude towards work
- ... does not flicker unpleasantly
- ... saves energy
- ... combats the winter blues
- ... is controlled electronically

One disadvantage of artificial lighting is that the source of light flickers in rhythm with the alternating current. It has been known for a long time that this causes headaches, tired eyes and lack of concentration.

GLOBALMIND's lamps give off white light - very similar to sunlight as regards the colour composition. These exclusive lamps are designed so that the height can be adjusted and direction of the light changed. The flickering of the light is eliminated by means of a special converter which makes it possible to turn the fluorescent lamp on instantaneously with a special touch switch.

On account of these special features, GLOBALMIND's *DeskLight* not only benefits your eyes, but also prevents winter depression.

Concept by GLOBALMIND under the supervision  
of Alexander Wunsch, doctor in Heidelberg
